Short Description

Sky Watcher 102 EQ1 Maksutov-Cassegrain

A great set up for the beginner who wants to look at the planets.

This optical tube assembly (OTA) allows a maximum practical magnification of 204x and gives great views of Jupiter, Saturn and the Moon.

Description

The 102mm diameter /F1300mm EQ1 Maksutov-Cassegrain

The Maksutov-Cassegrain is one of the two most popular Cassegrain telescopes in the world today that combines a front meniscus lens and two mirrors to deliver a longer focal length than a sister Schmidt Cassegrain telescope of the same diameter. With a longer focal length for the same aperture, this allows high magnification than other scopes of the same diameter and is ideally suited to planetary viewing.

The EQ1 Equatorial Mount

The EQ1 is a lightweight equatorial mount. An equatorial mount is able to compensate for Earth's rotation by moving along only one axis.

This gives the observer a great advantage as it is only necessary to turn a single slow motion knob while you manually track an object across the sky.
