Swarovski NL Pure 10x32 Binoculars Burnt Orange

AUD
\$3,870.00

Product Images

Short Description

When every detail counts – with 10x magnification, the NL Pure 32 guarantees you won't miss a thing.

NOTE: FRP Forehead Rest is NOT included. This is separate item.

Description

With its light weight (640 g/22.5 oz) and compact design the NL 10 x 32 will allow you to observe in comfort, even for long periods.

The field of view describes the size of the image section that can be seen through the optics. This is specified either in meters (width) at a distance of 1000 meters (m/1000m), or feet (width) at a distance of 1000 yards (ft/1000 yds), or as an angle (degrees). The higher the magnification, the smaller the field of view.

The magnification specifies the factor by which an object appears to be closer in comparison with the actual distance. The higher the magnification, the closer the object seems to be. However, a higher magnification also means a smaller field of view. Check the precise product name as the number in front of the 'x' specifies the magnification. For example, 10 x 32 is a device with 10 x magnification.

Binoculars have a large field of view, which means you can see a wide area. Spotting scopes have a higher magnification, which makes the field of view much smaller, but you can see more detail.

The objective lens diameter specifies how much light can enter the optics. This makes it a key factor in an instrument's performance, for example, in twilight. The bigger the objective lens diameter, the more light the objective lens can capture. The darker the surroundings, the larger the objective lens diameter needs to be. Check the precise product name as the number after the 'x' specifies the objective lens diameter in millimeters.

For example, a device with the suffix 10 x 32 has a front objective lens with a diameter of 32 mm.

Includes

- Carrying strap
- Eyepiece protective cover
- Objective lens cover
- Strap loop connector
- Functional side bag
- Cleaning cloth
- Soap
- Brush
