saxon 1.25 Inch 10mm Erecting Eyepiece with Extension Tube

AUD \$79.00

Product Images

Short Description

This eyepiece can be used with a reflector telescope to achieve an upright image for terrestrial viewing.

Please read detailed description below for information on viewing experience.

Description

The saxon 10mm erecting eyepiece with extension tube provides upright, correctly-oriented images for land observations.

This eyepiece can be used on any telescope.

For use on a refractor or catadioptric telescope, ensure the eyepiece is inserted directly into the focuser. No diagonal is required. The extension tube should be used only where focusing is not possible with just the eyepiece.

An extension tube should be used only when focussing is not possible. These extension tubes are available separately.

NOTE: Whilst the inverted image will be flipped to correct orientation, due to the nature of a reflector telescope the image will not be completely right side up when looking into the eyepiece .

You may still be off on the vertical orientation to your eye when looking into the eyepiece perpendicular to the telescope. This means that you will need to rotate your body and head a little to correct for this.
