Short Description

..

Description

The **saxon GSM Gemological Microscope 10x-80x** is powerful microscope to study small stones and gemstones.

This microscope features a zoom lens which allows you to zoom in and out from the object effortlessly with just a twist of a knob. For lighting options, the transmitted and relected light can be turned on together or on its own, giving you more room to inspect the surface details and structures of the object.

Use the gem tweezer to help hold your stone in place while you focus until image is clear. If you want to observe the stone at a different angle, simply rotate the tweezer until the angle comes in view.

Easy to use and powered by the supplied AC adapter, this is an ideal microscope for hobbyist and gemologist.
